

Sustainability

Sustainability

100% of our projects use sustainable building practices.

For S. M. Wilson, sustainability stretches beyond the built environment to our employees and our community. We expect our buildings and our environmental and social contributions to span generations.

Green Construction Practices

As a builder, it is our responsibility to construct each and every project in a sustainable manner for the environment, our clients and the community. S. M. Wilson's largest environmental impact results from construction activities at jobsites. Therefore, we implement air quality control, utilization of local materials, recycling and paper reduction on all projects to help reduce waste and pollutants and save our earth's natural resources. Sustainability is simply the better way to build.
